Parmelia saxatilis

Parmelia sulcata

Parmelina tiliacea

Peltigera

hymenina

A photograph of a lichen specimen, *Peltigera membranacea*, mounted on a red plate. The specimen consists of dark, irregularly shaped, leaf-like lobes with a slightly wrinkled texture, interspersed with green, moss-like growths. A small, light-colored, rectangular label is placed horizontally across the center of the specimen, containing the text "Peltigera membranacea" in black, sans-serif font. The red plate has a subtle circular pattern and a slight shadow, suggesting it is resting on a surface.

Peltigera membranacea

Parmeliopsis *ambigua*

Peltigera canina

A herbarium specimen of the lichen *Peltigera neopolydactyla* is mounted on a red plate. The specimen consists of several lobes of the lichen, which are greyish-green with dark brown, rounded, finger-like projections (polydactylous lobes). The lichen is growing on a substrate of green moss and small brown twigs. A white rectangular label is placed horizontally across the center of the specimen, with the name *Peltigera neopolydactyla* printed in black text.

Peltigera neopolydactyla

Peltigera praetextata

Pertusaria albescens

The image shows several fragments of a lichen specimen, *Pertusaria amara*, resting on a bright orange surface. The lichen fragments are light grey to white, with a highly textured, granular appearance. One fragment in the lower right shows a darker, more irregular structure with some greenish-yellow patches. A white rectangular label is placed horizontally across the center of the specimens, with the text "Pertusaria amara" printed in black. The label is divided into two sections by a vertical line, with the text spanning across it.

Pertusaria amara

A photograph of a lichen specimen, *Platismatia glauca*, resting on a red plate. The lichen is a complex, multi-colored mass of green, grey, and white. A small, rectangular, light-colored label is placed horizontally across the center of the specimen, with the text "Platismatia glauca" printed in black. The background is a solid, bright red surface.

Platismatia glauca

A photograph of a lichen specimen, *Punctelia borreri*, growing on a piece of wood. The lichen is a pale, bluish-green color with a cracked, crusty appearance. The wood is dark and textured. The specimen is placed on an orange surface. Below the specimen is a white label with the name *Punctelia borreri* printed in black.
